

User Management

Admin Training Manual

Route: /admin-user-management

Generated: May 9, 2026

1. Section Overview

User Management lists customer, support, and admin accounts with status and activity counts.

2. Purpose

Use this section to find users, review role and subscription state, create support agents, and perform approved reset workflows.

3. Access Requirements

- Sign in with an account that has admin access.
- Use the staging or production URL assigned by operations.
- Do not share admin sessions, reset links, exported files, or customer records.
- If access is denied, confirm the account role before retrying the workflow.

4. Main Dashboard Overview

- Search finds users by email or display name.
- Role filter narrows the list.
- Pagination shows the visible range and total matching users.
- User cards show plan, role, and activity counts.

5. Step-by-Step Instructions

1. Open User Management.
2. Confirm you are in the correct environment.
3. Apply the needed search, filter, tab, or selection.
4. Review the displayed information before making changes.
5. Complete one action at a time.

6. Refresh or reopen the page to confirm the result persisted.
7. Check Activity Logs or Error Logs when confirmation is unclear.

6. Common Tasks

- Find a user account.
- Confirm role and subscription status.
- Create a support agent when approved.
- Reset user data only for approved repair cases.

7. Common Errors

- Page does not load or shows access denied.
- Search or filters hide the expected record.
- Save does not persist after refresh.
- A required field, evidence item, or approval is missing.

8. Troubleshooting

- Refresh once and retry the exact action.
- Clear filters and search again.
- Confirm the account has admin access.
- Check Activity Logs for successful actions and Error Logs for failures.
- Stop and escalate if the workflow could change live customer data unexpectedly.

9. Best Practices

- Work from the least risky action to the most sensitive action.
- Use exact emails, IDs, and timestamps when reviewing records.
- Keep notes short, factual, and customer-safe.
- Never reset a user without written approval.
- Use exact email confirmation for sensitive actions.
- Setup links should point to the current environment.

10. Operational Notes

- Pagination now uses total record counts.
- Support-agent setup links are environment-aware after the 2026-05-09 repair.
- Screenshots are not embedded because live admin pages can expose user data. Add sanitized

screenshots from a seeded training tenant when available.

- A task is complete only when the page shows the expected saved state, a refresh keeps the state, and related logs or downstream records agree with the change.
