

Risk Triage

Admin Training Manual

Route: /admin-risk-triage

Generated: May 9, 2026

1. Section Overview

Risk Triage helps admins review high-risk accounts, parser issues, and finding correction candidates.

2. Purpose

Use this section to decide which reports or accounts need manual review before customer-facing output is trusted.

3. Access Requirements

- Sign in with an account that has admin access.
- Use the staging or production URL assigned by operations.
- Do not share admin sessions, reset links, exported files, or customer records.
- If access is denied, confirm the account role before retrying the workflow.

4. Main Dashboard Overview

- Queue rows identify records that need review.
- Filters narrow by status, queue type, or severity.
- Actions link to parser review or finding correction workflows.

5. Step-by-Step Instructions

1. Open Risk Triage.
2. Confirm you are in the correct environment.
3. Apply the needed search, filter, tab, or selection.
4. Review the displayed information before making changes.
5. Complete one action at a time.
6. Refresh or reopen the page to confirm the result persisted.

7. Check Activity Logs or Error Logs when confirmation is unclear.

6. Common Tasks

- Review high-risk items.
- Open correction workflow for a finding.
- Escalate parser defects.
- Confirm evidence before relying on a finding.

7. Common Errors

- Page does not load or shows access denied.
- Search or filters hide the expected record.
- Save does not persist after refresh.
- A required field, evidence item, or approval is missing.

8. Troubleshooting

- Refresh once and retry the exact action.
- Clear filters and search again.
- Confirm the account has admin access.
- Check Activity Logs for successful actions and Error Logs for failures.
- Stop and escalate if the workflow could change live customer data unexpectedly.

9. Best Practices

- Work from the least risky action to the most sensitive action.
- Use exact emails, IDs, and timestamps when reviewing records.
- Keep notes short, factual, and customer-safe.
- Do not finalize unsupported findings.
- Clear filters if an expected queue item is hidden.

10. Operational Notes

- Screenshots are not embedded because live admin pages can expose user data. Add sanitized screenshots from a seeded training tenant when available.
- A task is complete only when the page shows the expected saved state, a refresh keeps the state, and related logs or downstream records agree with the change.
