

Rule Check Settings

Admin Training Manual

Route: /admin-compliance-config

Generated: May 9, 2026

1. Section Overview

Rule Check Settings controls detector thresholds, rule messaging, postal pricing, and limited production-mode settings.

2. Purpose

Use this section to tune how compliance findings are detected and explained.

3. Access Requirements

- Sign in with an account that has admin access.
- Use the staging or production URL assigned by operations.
- Do not share admin sessions, reset links, exported files, or customer records.
- If access is denied, confirm the account role before retrying the workflow.

4. Main Dashboard Overview

- Rule cards show each violation category.
- Threshold fields control sensitivity.
- Message fields control user-facing explanation text.
- Pricing fields control postal cost settings.

5. Step-by-Step Instructions

1. Open Rule Check Settings.
2. Confirm you are in the correct environment.
3. Apply the needed search, filter, tab, or selection.
4. Review the displayed information before making changes.
5. Complete one action at a time.

6. Refresh or reopen the page to confirm the result persisted.
7. Check Activity Logs or Error Logs when confirmation is unclear.

6. Common Tasks

- Adjust a detection threshold.
- Update customer-facing wording.
- Change postal pricing values.
- Reset unsaved changes.

7. Common Errors

- Page does not load or shows access denied.
- Search or filters hide the expected record.
- Save does not persist after refresh.
- A required field, evidence item, or approval is missing.

8. Troubleshooting

- Refresh once and retry the exact action.
- Clear filters and search again.
- Confirm the account has admin access.
- Check Activity Logs for successful actions and Error Logs for failures.
- Stop and escalate if the workflow could change live customer data unexpectedly.

9. Best Practices

- Work from the least risky action to the most sensitive action.
- Use exact emails, IDs, and timestamps when reviewing records.
- Keep notes short, factual, and customer-safe.
- Change one rule at a time.
- Use only valid non-negative pricing numbers.
- Run regression tests after meaningful rule changes.

10. Operational Notes

- Malformed postal pricing is rejected in both the UI and API.
- Screenshots are not embedded because live admin pages can expose user data. Add sanitized screenshots from a seeded training tenant when available.

- A task is complete only when the page shows the expected saved state, a refresh keeps the state, and related logs or downstream records agree with the change.
