

Lifecycle Testing

Admin Training Manual

Route: /admin-mock-lifecycle

Generated: May 9, 2026

1. Section Overview

Lifecycle Testing runs controlled mock-user workflows for end-to-end validation.

2. Purpose

Use this section to test the platform lifecycle without using a real customer account.

3. Access Requirements

- Sign in with an account that has admin access.
- Use the staging or production URL assigned by operations.
- Do not share admin sessions, reset links, exported files, or customer records.
- If access is denied, confirm the account role before retrying the workflow.

4. Main Dashboard Overview

- Controls create or manage mock lifecycle runs.
- Run output shows each stage and result.
- Cleanup actions remove mock test data when approved.

5. Step-by-Step Instructions

1. Open Lifecycle Testing.
2. Confirm you are in the correct environment.
3. Apply the needed search, filter, tab, or selection.
4. Review the displayed information before making changes.
5. Complete one action at a time.
6. Refresh or reopen the page to confirm the result persisted.
7. Check Activity Logs or Error Logs when confirmation is unclear.

6. Common Tasks

- Run a mock user lifecycle.
- Validate upload-to-packet flow.
- Confirm cleanup behavior.

7. Common Errors

- Page does not load or shows access denied.
- Search or filters hide the expected record.
- Save does not persist after refresh.
- A required field, evidence item, or approval is missing.

8. Troubleshooting

- Refresh once and retry the exact action.
- Clear filters and search again.
- Confirm the account has admin access.
- Check Activity Logs for successful actions and Error Logs for failures.
- Stop and escalate if the workflow could change live customer data unexpectedly.

9. Best Practices

- Work from the least risky action to the most sensitive action.
- Use exact emails, IDs, and timestamps when reviewing records.
- Keep notes short, factual, and customer-safe.
- Use only disposable mock accounts.
- Do not run cleanup against a real user.

10. Operational Notes

- Screenshots are not embedded because live admin pages can expose user data. Add sanitized screenshots from a seeded training tenant when available.
- A task is complete only when the page shows the expected saved state, a refresh keeps the state, and related logs or downstream records agree with the change.
