

Version Management

Admin Training Manual

Route: /admin-version-management

Generated: May 9, 2026

1. Section Overview

Version Management tracks releases, migration status, and feature flags.

2. Purpose

Use this section to understand release state and manage feature availability under approved change control.

3. Access Requirements

- Sign in with an account that has admin access.
- Use the staging or production URL assigned by operations.
- Do not share admin sessions, reset links, exported files, or customer records.
- If access is denied, confirm the account role before retrying the workflow.

4. Main Dashboard Overview

- Versions tab lists release records.
- Migrations tab shows migration metadata and status.
- Feature Flags tab controls staged feature access.

5. Step-by-Step Instructions

1. Open Version Management.
2. Confirm you are in the correct environment.
3. Apply the needed search, filter, tab, or selection.
4. Review the displayed information before making changes.
5. Complete one action at a time.
6. Refresh or reopen the page to confirm the result persisted.
7. Check Activity Logs or Error Logs when confirmation is unclear.

6. Common Tasks

- Review current release version.
- Mark migration metadata after verification.
- Enable or disable a feature flag for an approved audience.

7. Common Errors

- Page does not load or shows access denied.
- Search or filters hide the expected record.
- Save does not persist after refresh.
- A required field, evidence item, or approval is missing.

8. Troubleshooting

- Refresh once and retry the exact action.
- Clear filters and search again.
- Confirm the account has admin access.
- Check Activity Logs for successful actions and Error Logs for failures.
- Stop and escalate if the workflow could change live customer data unexpectedly.

9. Best Practices

- Work from the least risky action to the most sensitive action.
- Use exact emails, IDs, and timestamps when reviewing records.
- Keep notes short, factual, and customer-safe.
- Migration status buttons do not execute SQL.
- Use change approval before altering feature flags.

10. Operational Notes

- Migration buttons now say Mark Applied and Mark Rolled Back to match metadata-only behavior.
- Screenshots are not embedded because live admin pages can expose user data. Add sanitized screenshots from a seeded training tenant when available.
- A task is complete only when the page shows the expected saved state, a refresh keeps the state, and related logs or downstream records agree with the change.
