

Home Dashboard

Admin Operations and Configuration Manual

Manual 01 of 25
Route: /
Group: Platform
Generated: May 10, 2026

1. Section Overview

The Home Dashboard is the admin starting point for platform operations. It summarizes current operational state and gives fast access to user management, risk triage, rule configuration, logs, version tools, and lifecycle testing.

Use this page at the beginning and end of an admin session to orient work, choose the right queue, and verify that recent operations changed the broader platform state as expected.

2. Current Admin Screenshot

Screenshot source: localhost development admin environment with test data. Test data is permitted for these manuals and should still be treated as internal.

The screenshot shows the admin sidebar, platform scope banner, dashboard quick actions, activity widgets, and current admin identity.

3. Access and Operating Rules

- Sign in with an account that has admin access. Support users may see some reference sections, but admin configuration and review tools require admin role.
- Use the intended environment. Local admin browser testing uses `http://localhost:5175`. The backend port, `http://localhost:3333`, is API-only.
- Treat screenshots, exports, logs, report text, and record IDs as internal test-environment material. Do not paste them into public channels.
- Confirm the page route, active filters, selected user, selected report, and selected environment before any save, delete, reset, dismissal, or finalize action.
- When an action affects customer-facing findings, packets, pricing, feature flags, or parser truth, record the reason and verify the downstream record after refresh.
- Dashboard counts are orientation signals. They are not a substitute for opening the source queue and checking the record.
- Use the sidebar group labels to decide whether a task is operational, legal/reference, or tooling-related.
- When counts look stale after a save elsewhere, refresh the dashboard once and compare Activity Logs before retrying the action.

4. Screen Anatomy and Controls

Area	What it means	Admin procedure
Admin quick actions	Links to high-frequency admin work areas such as User Management, Risk Triage, Rule Check Settings, Activity Logs, Version Management, and Lifecycle Testing.	Use these links instead of memorized URLs so you know the sidebar route is discoverable and active.
Sidebar navigation	Groups platform, legal/rules, and tools sections.	Use the search field to confirm a section exists before assuming a feature is missing.
Hidden risk widget	Summarizes active compliance risk signals for admin review.	Open Risk Triage for the source records before relying on counts alone.
Profile/session footer	Shows the logged-in admin and system status.	Confirm you are signed in as the intended admin before sensitive operations.

5. Step-by-Step Instructions

Start-of-shift platform review

Use this procedure to decide which admin queues need attention before changing any records.

Procedure

1. Open the Home Dashboard and confirm the platform scope banner shows the Canadian credit bureau compliance scope.

2. Confirm the logged-in identity in the sidebar footer is the expected admin account.
3. Scan the quick-action cards and hidden-risk summary for counts that indicate pending operational work.
4. Open Risk Triage first if high-risk or needs-review counts are non-zero.
5. Open Error Logs before changing settings if the dashboard or a queue looks incomplete.
6. Use Activity Logs to review overnight admin actions before assuming no one else changed a record.

Verification

- The target queue is identified before changes begin.
- Any stale or conflicting count has been checked against the source page.
- The first operational action is opened from the dashboard or sidebar, not from an old URL.

End-of-shift confirmation

Use this procedure to confirm that sensitive admin work actually persisted.

Procedure

1. Return to the Home Dashboard after completing user, risk, parser, support, or configuration work.
2. Refresh the page once to force a new read.
3. Compare dashboard counts to the records you changed. A resolved risk should leave the active queue, and a new support item should remain visible in Support Tickets until closed.
4. Open Activity Logs for the completed work and confirm the timestamp, actor, entity, and action type are present.
5. If a count did not update, reopen the source page and check whether a filter or stale cache explains the mismatch.

Verification

- Source page state, dashboard state, and Activity Logs do not conflict.
- Any mismatch is documented with screenshots and exact timestamps.

6. Common Tasks With Drilldown Examples

Choose the right admin tool

Example: A support agent reports a user cannot see a dispute packet, while the dashboard also shows hidden risk findings.

Drilldown procedure

1. Start on Home and identify whether the issue is a user/account problem, a compliance finding, or a packet generation problem.
2. Open User Management if the question is about role, subscription, login, user detail, or reset eligibility.
3. Open Risk Triage if the question is about a high-risk compliance finding or source evidence.
4. Open Parser Testing or Finding Corrections if the finding source or extraction truth is in question.
5. Open Activity Logs last to confirm what was actually changed.

Best practices for this task

- Do not jump directly to resetting user data when the issue may be a parser or packet state.
- Prefer the most specific source page for the record under review.

Done when

- The selected tool contains the affected record.
- The record ID or user email is captured before further action.

Confirm navigation coverage

Example: After a staging repair, verify Security & Compliance is visible to admins.

Drilldown procedure

1. Open the sidebar search field and type the expected section name.
2. Confirm the route appears in the correct group.
3. Open the page and wait for the body to load.
4. Confirm the page does not show access denied, not found, or unauthorized text.
5. Check whether the section also appears without search after clearing the search field.

Best practices for this task

- Navigation visibility is part of operational readiness. A working URL is not enough if admins cannot discover it.
- Use exact labels from the sidebar when documenting route coverage.

Done when

- The page loads from the sidebar.
- The route is visible in the intended group after clearing search.

7. Configuration and Change-Control Scope

- The dashboard does not directly change configuration. It routes admins to configuration sections.
- Do not infer that a workflow completed from a dashboard count alone. Verify on the source page.
- Use dashboard navigation to validate that newly added admin pages are discoverable in the expected group.

8. Common Errors

Problem	Likely cause	Admin response
Access denied or redirected to login	The session expired, the role is not admin, or the wrong environment is open.	Sign back in, confirm admin role, and reopen the route from the sidebar instead of using an old bookmark.
Expected record is missing	Search terms, tabs, filters, pagination, or environment selection are hiding the record.	Clear filters, search by exact ID or email, verify the environment, and compare Activity Logs when available.
Save appears to do nothing	Required fields are missing, there are no dirty changes, or the API returned a validation error.	Read the inline validation text, correct one field at a time, save again, refresh, and check Error Logs if the state still does not persist.
dashboard state conflicts with another page	The source record was changed elsewhere or the current page is stale.	Refresh the page, reopen the source record, and use timestamps or record IDs to decide which state is authoritative.

9. Troubleshooting

Check	Why it matters	How to proceed
Start with a refresh	A refresh confirms whether the dashboard view is stale or whether the backend rejected the action.	Refresh once, then repeat the exact search or selection. Do not repeat destructive actions until the latest state is visible.
Check Activity Logs	Successful admin actions should leave an audit trail for sensitive workflows.	Search by actor, affected user, entity ID, route, or timestamp. Use the log entry as confirmation, not just the toast message.
Check Error Logs	Repeated UI failures usually have matching server or API errors.	Search around the action time. Capture the route, status, error summary, and request context for developer follow-up.
Escalate with evidence	Developer review is faster when the exact record and reproduction path are known.	Provide environment, route, selected filters, record ID, expected outcome, actual outcome, screenshot, and timestamp.

10. Best Practices

- Begin risky work from Home so you can verify identity, scope, and environment.
- Treat dashboard totals as prompts to investigate, not as final operational evidence.
- Use the sidebar search field as the fastest way to locate admin tools during support calls.
- Document any dashboard/source-page mismatch with screenshots before rerunning sensitive actions.

11. Completion Checklist

- The dashboard page was reopened or refreshed after the change.
- The expected saved state remained visible after refresh.
- Related logs, downstream records, or generated artifacts agree with the visible page state.
- Any customer-facing wording, finding status, packet state, or support note was reviewed for factual and neutral language.
- Any unresolved risk, failed test, suspicious log, or unclear source evidence was escalated with record IDs and screenshots.
