

Admin Guide

Admin Operations and Configuration Manual

Manual 09 of 25
Route: /admin-knowledge-base
Group: Platform
Generated: May 10, 2026

1. Section Overview

Admin Guide is the internal knowledge base for platform operations, user support, compliance workflows, parser testing, version management, and reference procedures.

Use this page when you need operating guidance before changing settings, running sensitive tools, or answering support questions.

2. Current Admin Screenshot

Screenshot source: localhost development admin environment with test data. Test data is permitted for these manuals and should still be treated as internal.

The screenshot shows knowledge-base sections, guide navigation, and export/download affordances.

3. Access and Operating Rules

- Sign in with an account that has admin access. Support users may see some reference sections, but admin configuration and review tools require admin role.
- Use the intended environment. Local admin browser testing uses `http://localhost:5175`. The backend port, `http://localhost:3333`, is API-only.
- Treat screenshots, exports, logs, report text, and record IDs as internal test-environment material. Do not paste them into public channels.
- Confirm the page route, active filters, selected user, selected report, and selected environment before any save, delete, reset, dismissal, or finalize action.
- When an action affects customer-facing findings, packets, pricing, feature flags, or parser truth, record the reason and verify the downstream record after refresh.
- The guide is reference material. Source pages and logs remain authoritative for live records.
- If the guide conflicts with current UI behavior, record the mismatch and update documentation.
- Do not add secrets, private keys, tokens, reset links, or production credentials to guide content.

4. Screen Anatomy and Controls

Area	What it means	Admin procedure
Knowledge sections	Organize internal documentation by operating area.	Open the relevant section before using a workflow you do not perform regularly.
Admin procedures	Explain user, compliance, parser, support, and version workflows.	Use as the first stop for policy or workflow uncertainty.
PDF/export controls	Allow portable reference material where available.	Export only current internal materials and keep them in approved storage.

5. Step-by-Step Instructions

Use the guide before a sensitive workflow

Use when preparing for resets, retention, parser correction, rule changes, production mode, or support escalation.

Procedure

1. Open Admin Guide.
2. Find the section matching the workflow area.
3. Read the prerequisites, cautions, and completion criteria before opening the source page.
4. Open the source admin route in a new tab or from the sidebar.
5. Perform the action using the source page and verify through logs.
6. Return to the guide if an unexpected option appears or the source page has changed.

Verification

- The workflow was completed using current source UI.
- Any guide/source mismatch was captured for documentation repair.

Report outdated documentation

Use when the Admin Guide no longer matches the UI or operating practice.

Procedure

1. Capture the guide section title and the route it describes.
2. Capture a screenshot of the current UI state that differs from the guide.
3. Describe the expected correction in one or two factual sentences.
4. Check whether the generator or source component owns the content.
5. Create an internal follow-up or documentation update request with route and section references.

Verification

- The mismatch is reproducible and clearly described.
- The correction target is identified.

6. Common Tasks With Drilldown Examples**Find escalation guidance**

Example: You are unsure whether a parser finding should be corrected, rejected, or escalated.

Drilldown procedure

1. Open Admin Guide and search or scan for parser testing/finding correction content.
2. Read the action definitions and evidence requirements.
3. Open Finding Corrections and compare the live record to the documented requirements.
4. If requirements are incomplete, stop before finalizing and escalate.

Best practices for this task

- Do not finalize corrections based on incomplete documentation alone.
- Prefer evidence and source record checks over memory.

Done when

- The selected action is supported by guide instructions and source evidence.

Export a guide for internal training

Example: Operations needs a current PDF for new admin onboarding.

Drilldown procedure

1. Open the guide or sidebar export control.
2. Generate the current PDF.
3. Open the generated file and confirm date, title, and visible sections.

4. Store it only in approved internal training storage.
5. Regenerate after major UI, workflow, or policy changes.

Best practices for this task

- Use current PDFs only.
- Do not distribute internal manuals outside approved channels.

Done when

- The export opens and contains the expected current sections.

7. Configuration and Change-Control Scope

- The page itself is mostly reference content.
- Exported guides can become stale and should be regenerated after material UI or workflow changes.
- Documentation updates must reflect current admin navigation and controlled operations.

8. Common Errors

Problem	Likely cause	Admin response
Access denied or redirected to login	The session expired, the role is not admin, or the wrong environment is open.	Sign back in, confirm admin role, and reopen the route from the sidebar instead of using an old bookmark.
Expected record is missing	Search terms, tabs, filters, pagination, or environment selection are hiding the record.	Clear filters, search by exact ID or email, verify the environment, and compare Activity Logs when available.
Save appears to do nothing	Required fields are missing, there are no dirty changes, or the API returned a validation error.	Read the inline validation text, correct one field at a time, save again, refresh, and check Error Logs if the state still does not persist.
admin guide state conflicts with another page	The source record was changed elsewhere or the current page is stale.	Refresh the page, reopen the source record, and use timestamps or record IDs to decide which state is authoritative.

9. Troubleshooting

Check	Why it matters	How to proceed
Start with a refresh	A refresh confirms whether the admin guide view is stale or whether the backend rejected the action.	Refresh once, then repeat the exact search or selection. Do not repeat destructive actions until the latest state is visible.
Check Activity Logs	Successful admin actions should leave an audit trail for sensitive workflows.	Search by actor, affected user, entity ID, route, or timestamp. Use the log entry as confirmation, not just the toast message.

Check	Why it matters	How to proceed
Check Error Logs	Repeated UI failures usually have matching server or API errors.	Search around the action time. Capture the route, status, error summary, and request context for developer follow-up.
Escalate with evidence	Developer review is faster when the exact record and reproduction path are known.	Provide environment, route, selected filters, record ID, expected outcome, actual outcome, screenshot, and timestamp.

10. Best Practices

- Read guidance before high-impact workflows.
- Keep documentation current with route labels and button text.
- Use exported manuals as internal training aids only.
- Never store secrets in documentation.

11. Completion Checklist

- The admin guide page was reopened or refreshed after the change.
- The expected saved state remained visible after refresh.
- Related logs, downstream records, or generated artifacts agree with the visible page state.
- Any customer-facing wording, finding status, packet state, or support note was reviewed for factual and neutral language.
- Any unresolved risk, failed test, suspicious log, or unclear source evidence was escalated with record IDs and screenshots.
