

Letter Templates

Admin Operations and Configuration Manual

Manual 10 of 25
Route: /admin-letter-templates
Group: Platform
Generated: May 10, 2026

1. Section Overview

Letter Templates controls reusable wording for dispute and support packet generation. Template changes can affect customer-facing documents.

Use this section to review, edit, and verify approved template language without changing unsupported legal conclusions or weakening required dispute context.

2. Current Admin Screenshot

Screenshot source: localhost development admin environment with test data. Test data is permitted for these manuals and should still be treated as internal.

The screenshot shows the template list, editor surfaces, save controls, and current template content areas.

3. Access and Operating Rules

- Sign in with an account that has admin access. Support users may see some reference sections, but admin configuration and review tools require admin role.
- Use the intended environment. Local admin browser testing uses `http://localhost:5175`. The backend port, `http://localhost:3333`, is API-only.
- Treat screenshots, exports, logs, report text, and record IDs as internal test-environment material. Do not paste them into public channels.
- Confirm the page route, active filters, selected user, selected report, and selected environment before any save, delete, reset, dismissal, or finalize action.
- When an action affects customer-facing findings, packets, pricing, feature flags, or parser truth, record the reason and verify the downstream record after refresh.
- Template edits can change user-facing packet language. Treat them as controlled content changes.
- Do not introduce legal advice or promises of outcome.
- If a template depends on variables, verify that missing variables render safely.

4. Screen Anatomy and Controls

Area	What it means	Admin procedure
Template list	Shows available packet or support templates.	Select the exact template by purpose before editing.
Template editor	Displays the editable body and fields.	Keep wording specific, factual, and supported by platform evidence.
Save controls	Persist approved template changes.	Save only after review and keep a change note.
Preview/context	Where available, helps check how content reads in generated materials.	Preview before considering the change complete.

5. Step-by-Step Instructions

Edit approved template wording

Use when operations approves a wording correction or clarity improvement.

Procedure

1. Open Letter Templates and select the exact template.
2. Read the current wording and identify the section being changed.
3. Compare the requested change to the template's intended use.
4. Edit only the approved language. Avoid unrelated cleanup.
5. Check variables and placeholders for spelling and supported names.
6. Save and wait for confirmation.

7. Refresh, reopen the template, and verify the text persists.
8. Generate or preview a representative packet if the template is used in packet output.

Decision options

- Text persists after refresh.
- Representative generated output contains correct wording.
- Change reason is documented.

Verification

- Minor wording correction: save after internal approval.
- Legal/reference language change: route for compliance/legal review first.
- Variable behavior issue: escalate if preview output is wrong.

Review a template for plain language

Use when support reports that customers misunderstand a packet phrase.

Procedure

1. Open the template and identify the specific phrase.
2. Read the surrounding paragraph so the edit does not remove required context.
3. Rewrite for plain language while preserving facts, evidence requirements, and neutral tone.
4. Avoid terms that sound like guaranteed legal findings unless the finding is actually confirmed.
5. Preview the output and check line breaks, variables, and grammar.
6. Save only after the wording is approved.

Verification

- The revised wording is clearer and still accurate.
- No unsupported claim was added.

6. Common Tasks With Drilldown Examples

Fix a placeholder issue

Example: A generated letter shows a blank creditor name.

Drilldown procedure

1. Open the generated packet or support example and identify the blank field.
2. Open Letter Templates and find the template that produced the section.
3. Verify whether the placeholder name is correct and supported.
4. If the placeholder is wrong, correct it and preview.
5. If the placeholder is correct but the source data is missing, investigate parser/user data instead of changing the template.

Best practices for this task

- Do not hard-code customer or creditor information into shared templates.
- Distinguish template defects from missing source data.

Done when

- Preview output renders expected variables.
- Source data issues are escalated to the correct workflow.

Retire obsolete wording

Example: A template references an old workflow name.

Drilldown procedure

1. Identify every template that uses the obsolete wording.
2. Confirm the replacement wording and approval source.
3. Edit one template at a time.
4. Preview each affected packet/document path.
5. Record the changed templates in the internal note.

Best practices for this task

- Keep diffs focused.
- Avoid broad rewrites while fixing one obsolete phrase.

Done when

- All affected templates were checked.
- No unrelated content changed.

7. Configuration and Change-Control Scope

- Template wording affects generated letters or packets.
- Saved text may be reused across many users and reports.
- Template changes should have an approval reason and regression/preview check.

8. Common Errors

Problem	Likely cause	Admin response
Access denied or redirected to login	The session expired, the role is not admin, or the wrong environment is open.	Sign back in, confirm admin role, and reopen the route from the sidebar instead of using an old bookmark.
Expected record is missing	Search terms, tabs, filters, pagination, or environment selection are hiding the record.	Clear filters, search by exact ID or email, verify the environment, and compare Activity Logs when available.
Save appears to do nothing	Required fields are missing, there are no dirty changes, or the API returned a validation error.	Read the inline validation text, correct one field at a time, save again, refresh, and check Error Logs if the state still does not persist.
letter templates state conflicts with another page	The source record was changed elsewhere or the current page is stale.	Refresh the page, reopen the source record, and use timestamps or record IDs to decide which state is

Problem	Likely cause	Admin response
		authoritative.

9. Troubleshooting

Check	Why it matters	How to proceed
Start with a refresh	A refresh confirms whether the letter templates view is stale or whether the backend rejected the action.	Refresh once, then repeat the exact search or selection. Do not repeat destructive actions until the latest state is visible.
Check Activity Logs	Successful admin actions should leave an audit trail for sensitive workflows.	Search by actor, affected user, entity ID, route, or timestamp. Use the log entry as confirmation, not just the toast message.
Check Error Logs	Repeated UI failures usually have matching server or API errors.	Search around the action time. Capture the route, status, error summary, and request context for developer follow-up.
Escalate with evidence	Developer review is faster when the exact record and reproduction path are known.	Provide environment, route, selected filters, record ID, expected outcome, actual outcome, screenshot, and timestamp.

10. Best Practices

- Edit one template at a time.
- Preview representative output.
- Keep legal and compliance wording evidence-based.
- Document why wording changed.

11. Completion Checklist

- The letter templates page was reopened or refreshed after the change.
- The expected saved state remained visible after refresh.
- Related logs, downstream records, or generated artifacts agree with the visible page state.
- Any customer-facing wording, finding status, packet state, or support note was reviewed for factual and neutral language.
- Any unresolved risk, failed test, suspicious log, or unclear source evidence was escalated with record IDs and screenshots.
