

Laws

Admin Operations and Configuration Manual

Manual 12 of 25
Route: /statutes
Group: Legal & Rules
Generated: May 10, 2026

1. Section Overview

Laws provides statutory and regulatory reference material used to support compliance findings, templates, evidence review, and admin correction decisions.

Use this section to confirm legal references and jurisdiction context. It is operational reference material and must not be used to give individualized legal advice to customers.

2. Current Admin Screenshot

Screenshot source: localhost development admin environment with test data. Test data is permitted for these manuals and should still be treated as internal.

The screenshot shows statute/reference entries, jurisdiction context, and detail records.

3. Access and Operating Rules

- Sign in with an account that has admin access. Support users may see some reference sections, but admin configuration and review tools require admin role.
- Use the intended environment. Local admin browser testing uses `http://localhost:5175`. The backend port, `http://localhost:3333`, is API-only.
- Treat screenshots, exports, logs, report text, and record IDs as internal test-environment material. Do not paste them into public channels.
- Confirm the page route, active filters, selected user, selected report, and selected environment before any save, delete, reset, dismissal, or finalize action.
- When an action affects customer-facing findings, packets, pricing, feature flags, or parser truth, record the reason and verify the downstream record after refresh.
- Use legal references as internal operating support, not customer legal advice.
- Jurisdiction matters. Do not map a finding to a law that does not apply to the user/report context.
- If citation accuracy is uncertain, mark for reference review before finalizing.

4. Screen Anatomy and Controls

Area	What it means	Admin procedure
Law records	List statutes, summaries, and jurisdiction fields.	Confirm the exact authority before mapping a finding.
Details	Show context, citations, sections, and references where configured.	Use details to support admin correction and template review.
Related obligations	Connect laws to creditor, bureau, collector, or enforcement concepts.	Review the obligation page when practical duties matter.

5. Step-by-Step Instructions

Confirm a statutory reference

Use when a finding, template, or correction needs authority support.

Procedure

1. Open Laws and search for the statute, jurisdiction, or reference phrase.
2. Open the record and read jurisdiction, statute name, section, and summary.
3. Compare the reference to the affected finding category and user/report province where applicable.
4. Open related obligation pages if the question concerns a creditor, bureau, or collector duty.
5. Use the reference in admin notes only if it matches the issue and jurisdiction.
6. If unclear, mark citation for review rather than forcing a mapping.

Verification

- Reference jurisdiction and issue type match the finding.
- The admin note avoids giving customer-specific legal advice.

Support a finding correction decision

Use when finalizing, correcting, or rejecting a machine finding.

Procedure

1. Open the finding in Finding Corrections.
2. Identify the claimed issue, evidence fields, and affected province/jurisdiction.
3. Open Laws and find a matching statutory or regulatory reference.
4. Verify the citation text or source details.
5. Return to Finding Corrections and link or verify the reference only if it supports the corrected finding.
6. If the law does not support the finding, reject or reclassify the finding rather than stretching the citation.

Decision options

- Finalized finding has source evidence and matching authority where required.
- Unsupported findings are not finalized as confirmed violations.

Verification

- Confirm/correct: use when evidence and authority align.
- Reject: use when no authority supports the claim.
- Training note only: use when useful for future review but not actionable now.

6. Common Tasks With Drilldown Examples**Check jurisdiction-specific context**

Example: A finding depends on provincial limitation timing.

Drilldown procedure

1. Identify the user's province from the source record or account context.
2. Open Laws and filter/search for the province and issue type.
3. Compare timing, scope, and applicability to the source account.
4. Document the reference used and any uncertainty.
5. Escalate if the record lacks province or account-type data needed for exact mapping.

Best practices for this task

- Never borrow authority from another province because it looks similar.
- Missing province can block exact-field authority mapping.

Done when

- Jurisdiction is confirmed or the finding remains review-only.

Review a citation marked incorrect

Example: A previous admin marked a regulation reference incorrect in Finding Corrections.

Drilldown procedure

1. Open the correction and read the incorrect-reference note.
2. Open Laws and locate the disputed reference.
3. Check whether the issue is wrong jurisdiction, wrong section, stale text, or unsupported application.
4. Update the correction reference status only after verifying the correct source.
5. Escalate reference-data defects for update.

Best practices for this task

- Keep the old incorrect marker until a correct source is identified.
- Do not delete citation history just to make a finding look cleaner.

Done when

- Reference status reflects verified source review.

7. Configuration and Change-Control Scope

- Law/reference records can influence finding explanations, regulation mapping, and training examples.
- Reference changes require source verification.
- Admin-verified citation status should be used only after human validation.

8. Common Errors

Problem	Likely cause	Admin response
Access denied or redirected to login	The session expired, the role is not admin, or the wrong environment is open.	Sign back in, confirm admin role, and reopen the route from the sidebar instead of using an old bookmark.
Expected record is missing	Search terms, tabs, filters, pagination, or environment selection are hiding the record.	Clear filters, search by exact ID or email, verify the environment, and compare Activity Logs when available.
Save appears to do nothing	Required fields are missing, there are no dirty changes, or the API returned a validation error.	Read the inline validation text, correct one field at a time, save again, refresh, and check Error Logs if the state still does not persist.
laws references state conflicts with another page	The source record was changed elsewhere or the current page is stale.	Refresh the page, reopen the source record, and use timestamps or record IDs to decide which state is authoritative.

9. Troubleshooting

Check	Why it matters	How to proceed
Start with a refresh	A refresh confirms whether the laws references view is stale or whether the backend rejected the action.	Refresh once, then repeat the exact search or selection. Do not repeat destructive actions until the latest state is visible.
Check Activity Logs	Successful admin actions should leave an audit trail for sensitive workflows.	Search by actor, affected user, entity ID, route, or timestamp. Use the log entry as confirmation, not just the toast message.
Check Error Logs	Repeated UI failures usually have matching server or API errors.	Search around the action time. Capture the route, status, error summary, and request context for developer follow-up.
Escalate with evidence	Developer review is faster when the exact record and reproduction path are known.	Provide environment, route, selected filters, record ID, expected outcome, actual outcome, screenshot, and timestamp.

10. Best Practices

- Verify jurisdiction before relying on a law record.
- Use legal references as operational support, not legal advice.
- Do not finalize unsupported legal conclusions.
- Keep citation notes factual and source-backed.

11. Completion Checklist

- The laws references page was reopened or refreshed after the change.
- The expected saved state remained visible after refresh.
- Related logs, downstream records, or generated artifacts agree with the visible page state.
- Any customer-facing wording, finding status, packet state, or support note was reviewed for factual and neutral language.
- Any unresolved risk, failed test, suspicious log, or unclear source evidence was escalated with record IDs and screenshots.
