

Regulatory Updates

Admin Operations and Configuration Manual

Manual 18 of 25
Route: /regulatory-updates
Group: Legal & Rules
Generated: May 10, 2026

1. Section Overview

Regulatory Updates tracks changes that may affect platform rules, references, templates, training, and admin workflows. Use this section to review, classify, and coordinate approved regulatory knowledge updates before changing detectors, templates, references, or operating procedures.

2. Current Admin Screenshot

Screenshot source: localhost development admin environment with test data. Test data is permitted for these manuals and should still be treated as internal.

The screenshot shows regulatory update records, status, impact, and review context.

3. Access and Operating Rules

- Sign in with an account that has admin access. Support users may see some reference sections, but admin configuration and review tools require admin role.
- Use the intended environment. Local admin browser testing uses `http://localhost:5175`. The backend port, `http://localhost:3333`, is API-only.
- Treat screenshots, exports, logs, report text, and record IDs as internal test-environment material. Do not paste them into public channels.
- Confirm the page route, active filters, selected user, selected report, and selected environment before any save, delete, reset, dismissal, or finalize action.
- When an action affects customer-facing findings, packets, pricing, feature flags, or parser truth, record the reason and verify the downstream record after refresh.
- Do not change rules based on unverified updates.
- Regulatory changes often require coordinated updates across laws, obligations, templates, rule settings, parser tests, and training examples.
- A pending update should remain pending until source and impact are reviewed.

4. Screen Anatomy and Controls

Area	What it means	Admin procedure
Update list	Shows pending and historical updates.	Prioritize updates that affect active rules, packet language, or legal references.
Details	Explain source, jurisdiction, effective date, and affected areas.	Read details before changing any rule or reference data.
Actions/status	Support review and follow-up state.	Use status to make work visible to other admins.

5. Step-by-Step Instructions

Review a new regulatory update

Use when an update appears in the queue or is added by operations.

Procedure

1. Open Regulatory Updates and select the pending update.
2. Read source, jurisdiction, effective date, summary, and affected workflow areas.
3. Confirm the source is approved and current.
4. Identify impacted pages: Laws, obligations, Rule Check Settings, Letter Templates, Finding Corrections, Parser Testing, or Admin Guide.
5. Document required follow-up tasks and owners.
6. Do not mark complete until the downstream changes and checks are done.

Verification

- Update has source verification and impact assessment.
- Follow-up tasks identify affected platform areas.

Coordinate downstream changes

Use after an update is verified and approved.

Procedure

1. Update reference content first so citations and obligations are correct.
2. Review detector thresholds or categories only if the update changes detection behavior.
3. Review templates if customer-facing language changes.
4. Add or update parser/regression fixtures if source data interpretation changes.
5. Run targeted tests and source-page previews.
6. Record the completed changes and residual risks.

Decision options

- All affected pages were reviewed.
- Testing or preview evidence is attached to the update note.

Verification

- Reference-only update: update Laws/obligation pages and documentation.
- Detector update: change Rule Check Settings and run regression checks.
- Template update: revise Letter Templates and preview output.

6. Common Tasks With Drilldown Examples

Identify affected rule categories

Example: A new timing interpretation affects stale reporting review.

Drilldown procedure

1. Read the regulatory update summary and source.
2. Map the issue to existing finding categories.
3. Open Rule Check Settings to see whether a threshold or enabled state is involved.
4. Open Risk Triage to sample current affected findings.
5. Open Finding Corrections to inspect whether existing training examples need review.

Best practices for this task

- Do not infer category impact without checking current detector categories.
- Document when no existing category is affected.

Done when

- Impacted categories are listed with required action or no-action reason.

Retest affected workflows

Example: An update changes wording used in a dispute template.

Drilldown procedure

1. Apply approved reference/template changes.
2. Generate a representative output or preview.
3. Run targeted parser or finding-correction tests if detection behavior changed.
4. Open Activity Logs to confirm sensitive changes.
5. Update the regulatory update status only after verification.

Best practices for this task

- Preview customer-facing outputs after wording changes.
- Run regression when detection or parser behavior changes.

Done when

- Affected workflow has test or preview evidence.

7. Configuration and Change-Control Scope

- Updates may lead to reference data, detector, template, or workflow changes.
- Status changes affect operational tracking.
- Implementation requires downstream verification.

8. Common Errors

Problem	Likely cause	Admin response
Access denied or redirected to login	The session expired, the role is not admin, or the wrong environment is open.	Sign back in, confirm admin role, and reopen the route from the sidebar instead of using an old bookmark.
Expected record is missing	Search terms, tabs, filters, pagination, or environment selection are hiding the record.	Clear filters, search by exact ID or email, verify the environment, and compare Activity Logs when available.
Save appears to do nothing	Required fields are missing, there are no dirty changes, or the API returned a validation error.	Read the inline validation text, correct one field at a time, save again, refresh, and check Error Logs if the state still does not persist.
regulatory updates state conflicts with another page	The source record was changed elsewhere or the current page is stale.	Refresh the page, reopen the source record, and use timestamps or record IDs to decide which state is authoritative.

9. Troubleshooting

Check	Why it matters	How to proceed
-------	----------------	----------------

Check	Why it matters	How to proceed
Start with a refresh	A refresh confirms whether the regulatory updates view is stale or whether the backend rejected the action.	Refresh once, then repeat the exact search or selection. Do not repeat destructive actions until the latest state is visible.
Check Activity Logs	Successful admin actions should leave an audit trail for sensitive workflows.	Search by actor, affected user, entity ID, route, or timestamp. Use the log entry as confirmation, not just the toast message.
Check Error Logs	Repeated UI failures usually have matching server or API errors.	Search around the action time. Capture the route, status, error summary, and request context for developer follow-up.
Escalate with evidence	Developer review is faster when the exact record and reproduction path are known.	Provide environment, route, selected filters, record ID, expected outcome, actual outcome, screenshot, and timestamp.

10. Best Practices

- Verify source and jurisdiction before action.
- Map impact across rules, references, templates, parser, and training.
- Retest affected workflows.
- Keep status aligned with real completion, not just review start.

11. Completion Checklist

- The regulatory updates page was reopened or refreshed after the change.
- The expected saved state remained visible after refresh.
- Related logs, downstream records, or generated artifacts agree with the visible page state.
- Any customer-facing wording, finding status, packet state, or support note was reviewed for factual and neutral language.
- Any unresolved risk, failed test, suspicious log, or unclear source evidence was escalated with record IDs and screenshots.
