

Finding Corrections

Admin Operations and Configuration Manual

Manual 21 of 25
Route: /admin-parser-testing?tab=violation-corrections
Group: Tools
Generated: May 10, 2026

1. Section Overview

Finding Corrections is the admin truth layer for reviewing, correcting, rejecting, adding, finalizing, and training compliance findings derived from parser extraction runs.

Use this section when a machine finding needs human review, evidence linking, regulation mapping, authority verification, training label assignment, or source-backed finalization.

2. Current Admin Screenshot

Screenshot source: localhost development admin environment with test data. Test data is permitted for these manuals and should still be treated as internal.

The screenshot shows the Finding Corrections tab with run selection, tradeline/finding context, correction controls, evidence, references, and finalization surfaces.

3. Access and Operating Rules

- Sign in with an account that has admin access. Support users may see some reference sections, but admin configuration and review tools require admin role.
- Use the intended environment. Local admin browser testing uses `http://localhost:5175`. The backend port, `http://localhost:3333`, is API-only.
- Treat screenshots, exports, logs, report text, and record IDs as internal test-environment material. Do not paste them into public channels.
- Confirm the page route, active filters, selected user, selected report, and selected environment before any save, delete, reset, dismissal, or finalize action.
- When an action affects customer-facing findings, packets, pricing, feature flags, or parser truth, record the reason and verify the downstream record after refresh.
- Use the product term compliance finding unless authority and review support confirmed legal violation language.
- Finalize only when action, evidence, and regulation requirements are satisfied.
- Training note only is for useful review data that should not become an actionable customer-facing finding.

4. Screen Anatomy and Controls

Area	What it means	Admin procedure
Run list	Shows extraction runs and finding counts.	Select the source run that matches the Risk Triage or parser test case.
Tradeline list	Shows accounts in the selected run.	Choose the exact account before editing a finding.
Original Extraction	Displays machine-generated finding details.	Use as input to review, not as final truth.
Admin Correction	Stores action, corrected type, severity, summary, explanation, notes, and training label.	Save before linking evidence or references.
Evidence	Links source quotes, pages, fields, normalized values, and reasons.	Finalized actionable findings need source evidence unless marked training note only.
Regulation Mapping	Links, verifies, marks incorrect, or removes authority references.	Use verified citations only after admin validation.

5. Step-by-Step Instructions

Review and correct a machine finding

Use when Risk Triage or Parser Testing identifies a finding that needs human adjudication.

Procedure

1. Open Finding Corrections with the run, tradeline, and finding selected when possible.
2. Confirm extraction run ID, tradeline ID, creditor, bureau, and account mask.
3. Read the original machine finding category, severity, summary, explanation, confidence, and technical details.
4. Compare the finding to source report evidence and parser output.
5. Choose the correction action: Confirm, Correct, Reject, Missed Issue, or Training Note Only.
6. If correcting, enter corrected type, severity, confidence, summary, explanation, correction reason, and admin notes.
7. Save the correction before linking evidence or regulation references.
8. Add evidence with source excerpt, page/field context, normalized value, and reason.
9. Add or verify regulation references only when authority supports the finding.
10. Finalize when requirements are complete. Refresh and confirm finalized state persists.

Decision options

- Saved correction persists after refresh.
- Evidence and references are linked where required.
- Finalized state is visible and searchable.

Verification

- Confirm: machine finding is accurate and supported.
- Correct: finding exists but category, severity, explanation, evidence, or mapping is wrong.
- Reject: machine finding is false positive or unsupported.
- Missed Issue: source supports a finding the machine missed.
- Training Note Only: useful for future learning but not actionable now.

Add a missed issue

Use when source evidence supports a compliance finding that the machine did not create.

Procedure

1. Select the extraction run and tradeline.
2. Click or choose the missed-issue path.
3. Enter the corrected finding type, severity, confidence, summary, and explanation.
4. Set training label to false negative where appropriate.
5. Save the correction.
6. Add source evidence proving the issue exists.
7. Add regulation reference if the issue will be actionable.
8. Finalize only after evidence and reference checks are complete.

Verification

- The missed issue is tied to exact source scope.
- It does not duplicate an existing active finding category for the same account unless justified.

6. Common Tasks With Drilldown Examples

Reject a false positive finding

Example: The detector flagged stale reporting, but source dates show the account was updated correctly.

Drilldown procedure

1. Select the run, tradeline, and original finding.
2. Set correction action to Rejected.
3. Set training label to False Positive if the record should train future behavior.
4. Enter a correction reason explaining why the source evidence does not support the finding.
5. Add evidence or mark Training Note Only depending on the workflow requirements.
6. Save and finalize when complete.
7. Return to Risk Triage and verify the active queue reflects the decision if applicable.

Best practices for this task

- Reject for evidence reasons, not convenience.
- Keep the explanation factual and specific.

Done when

- Rejected correction persists and the active queue state matches expected behavior.

Verify or mark regulation references incorrect

Example: A mapped reference appears to cite the wrong section.

Drilldown procedure

1. Open the linked reference and read jurisdiction, body, regulation, section, and text.
2. Compare to Laws and obligation pages.
3. If correct, mark/admin-verify the citation only after source validation.
4. If wrong, mark incorrect and add a note explaining why.
5. Add a correct replacement reference if available.
6. Do not finalize an actionable confirmed/corrected finding with only an incorrect reference.

Best practices for this task

- Incorrect is a meaningful review state; do not delete history just to hide a bad mapping.
- Use verified only for source-checked citations.

Done when

- Reference status accurately reflects admin review.
- Finalized actionable findings have active supported references.

7. Configuration and Change-Control Scope

- Corrections can influence the deterministic admin truth layer used by future finding retrieval.
- Finalized positive corrections can support future canonical findings and training examples.
- Rejected corrections can suppress false positives for exact source scope.

8. Common Errors

Problem	Likely cause	Admin response
Access denied or redirected to login	The session expired, the role is not admin, or the wrong environment is open.	Sign back in, confirm admin role, and reopen the route from the sidebar instead of using an old bookmark.
Expected record is missing	Search terms, tabs, filters, pagination, or environment selection are hiding the record.	Clear filters, search by exact ID or email, verify the environment, and compare Activity Logs when available.
Save appears to do nothing	Required fields are missing, there are no dirty changes, or the API returned a validation error.	Read the inline validation text, correct one field at a time, save again, refresh, and check Error Logs if the state still does not persist.
finding corrections state conflicts with another page	The source record was changed elsewhere or the current page is stale.	Refresh the page, reopen the source record, and use timestamps or record IDs to decide which state is authoritative.

9. Troubleshooting

Check	Why it matters	How to proceed
Start with a refresh	A refresh confirms whether the finding corrections view is stale or whether the backend rejected the action.	Refresh once, then repeat the exact search or selection. Do not repeat destructive actions until the latest state is visible.
Check Activity Logs	Successful admin actions should leave an audit trail for sensitive workflows.	Search by actor, affected user, entity ID, route, or timestamp. Use the log entry as confirmation, not just the toast message.
Check Error Logs	Repeated UI failures usually have matching server or API errors.	Search around the action time. Capture the route, status, error summary, and request context for developer follow-up.
Escalate with evidence	Developer review is faster when the exact record and reproduction path are known.	Provide environment, route, selected filters, record ID, expected outcome, actual outcome, screenshot, and timestamp.

10. Best Practices

- Save the correction before linking evidence or references.
- Use exact source excerpts and field names.
- Do not finalize unsupported findings.
- Keep training labels aligned with the correction action.
- Use confirmed legal violation language only when evidence and authority support it.

11. Completion Checklist

- The finding corrections page was reopened or refreshed after the change.
- The expected saved state remained visible after refresh.
- Related logs, downstream records, or generated artifacts agree with the visible page state.
- Any customer-facing wording, finding status, packet state, or support note was reviewed for factual and neutral language.
- Any unresolved risk, failed test, suspicious log, or unclear source evidence was escalated with record IDs and screenshots.
