

AI Assist

Admin Operations and Configuration Manual

Manual 23 of 25
Route: /admin-ai-assist
Group: Tools
Generated: May 10, 2026

1. Section Overview

AI Assist helps admins draft internal summaries, investigate support or compliance context, and organize review questions. Use AI Assist as a drafting and thinking aid. It must not replace source evidence, admin judgment, legal review, parser correction, or authority mapping.

2. Current Admin Screenshot

Screenshot source: localhost development admin environment with test data. Test data is permitted for these manuals and should still be treated as internal.

The screenshot shows the AI Assist prompt and response workspace used for internal admin help.

3. Access and Operating Rules

- Sign in with an account that has admin access. Support users may see some reference sections, but admin configuration and review tools require admin role.
- Use the intended environment. Local admin browser testing uses `http://localhost:5175`. The backend port, `http://localhost:3333`, is API-only.
- Treat screenshots, exports, logs, report text, and record IDs as internal test-environment material. Do not paste them into public channels.
- Confirm the page route, active filters, selected user, selected report, and selected environment before any save, delete, reset, dismissal, or finalize action.
- When an action affects customer-facing findings, packets, pricing, feature flags, or parser truth, record the reason and verify the downstream record after refresh.
- AI output can be wrong or incomplete.
- Do not paste secrets, tokens, reset links, private keys, or unrelated customer records.
- Use source pages and logs as the authority for factual statements.

4. Screen Anatomy and Controls

Area	What it means	Admin procedure
Prompt area	Accepts admin questions and context.	Ask focused questions and avoid unnecessary sensitive data.
Response area	Returns assistance for the prompt/context.	Verify facts in source records before acting.
Context links/params	May be opened from Risk Triage with finding context.	Confirm the linked record before using the output.

5. Step-by-Step Instructions

Summarize a support issue

Use to turn verified source facts into an internal working summary.

Procedure

1. Open the relevant ticket, user, risk, or parser record first.
2. Collect only the necessary facts: route, user role, finding category, source status, and verified dates.
3. Open AI Assist and ask for an internal summary with review questions.
4. Compare every factual claim in the response against source pages.
5. Remove unsupported claims, legal advice, and internal implementation details before using in a ticket note.
6. Use the summary as a draft, not as final evidence.

Verification

- Final note contains verified facts only.
- Source record references are retained separately from AI prose.

Draft next review steps

Use when a complex risk item needs a checklist before action.

Procedure

1. Open AI Assist with the finding or issue context.
2. Ask for review steps grouped by source evidence, parser truth, regulation mapping, and customer-safe communication.
3. Remove any step that is not supported by actual platform pages.
4. Execute the checklist manually in Risk Triage, Parser Testing, Laws, or Support Tickets.
5. Document actual outcomes from source pages, not the suggested plan alone.

Verification

- Checklist steps map to real pages and records.
- Completed outcomes are source-backed.

6. Common Tasks With Drilldown Examples

Preview a risk finding explanation

Example: Risk Triage opens AI Preview for a high-risk stale-reporting finding.

Drilldown procedure

1. Open the AI Preview from the exact finding row.
2. Ask for a neutral internal explanation and evidence questions.
3. Open the Account and Fix Source pages to verify each point.
4. Discard or correct any unsupported statement.
5. Use the verified version for internal notes or support drafting only.

Best practices for this task

- AI Preview is not a false-positive decision.
- Do not rely on AI for citation verification.

Done when

- The final explanation is verified against source records.

Draft customer-safe language

Example: A support reply needs a concise explanation of what was reviewed.

Drilldown procedure

1. Provide AI Assist only with verified facts and the desired tone.
2. Ask for plain-language wording without legal advice or guarantees.
3. Remove internal IDs, stack traces, route names, and unsupported conclusions.
4. Compare the draft to the ticket and source records before sending.

Best practices for this task

- Never send AI output unreviewed.
- Keep legal and compliance conclusions cautious.

Done when

- Reply is factual, customer-safe, and source-backed.

7. Configuration and Change-Control Scope

- AI Assist does not directly change records unless the UI later provides explicit actions.
- Prompts and responses may contain sensitive internal test data and should be treated as internal.
- Customer-facing text drafted with AI must be reviewed and edited.

8. Common Errors

Problem	Likely cause	Admin response
Access denied or redirected to login	The session expired, the role is not admin, or the wrong environment is open.	Sign back in, confirm admin role, and reopen the route from the sidebar instead of using an old bookmark.
Expected record is missing	Search terms, tabs, filters, pagination, or environment selection are hiding the record.	Clear filters, search by exact ID or email, verify the environment, and compare Activity Logs when available.
Save appears to do nothing	Required fields are missing, there are no dirty changes, or the API returned a validation error.	Read the inline validation text, correct one field at a time, save again, refresh, and check Error Logs if the state still does not persist.
AI assist state conflicts with another page	The source record was changed elsewhere or the current page is stale.	Refresh the page, reopen the source record, and use timestamps or record IDs to decide which state is authoritative.

9. Troubleshooting

Check	Why it matters	How to proceed
Start with a refresh	A refresh confirms whether the AI assist view is stale or whether the backend rejected the action.	Refresh once, then repeat the exact search or selection. Do not repeat destructive actions until the latest state is visible.
Check Activity Logs	Successful admin actions should leave an audit trail for sensitive workflows.	Search by actor, affected user, entity ID, route, or timestamp. Use the log entry as confirmation, not just the toast message.
Check Error Logs	Repeated UI failures usually have matching server or API errors.	Search around the action time. Capture the route, status, error summary, and request context for developer follow-up.

Check	Why it matters	How to proceed
Escalate with evidence	Developer review is faster when the exact record and reproduction path are known.	Provide environment, route, selected filters, record ID, expected outcome, actual outcome, screenshot, and timestamp.

10. Best Practices

- Ask focused questions.
- Minimize sensitive context.
- Verify every factual statement.
- Use AI for drafts and checklists, not final decisions.

11. Completion Checklist

- The AI assist page was reopened or refreshed after the change.
- The expected saved state remained visible after refresh.
- Related logs, downstream records, or generated artifacts agree with the visible page state.
- Any customer-facing wording, finding status, packet state, or support note was reviewed for factual and neutral language.
- Any unresolved risk, failed test, suspicious log, or unclear source evidence was escalated with record IDs and screenshots.
